

BOOLE™

s e r v e r

Microsoft® SharePoint® Connector

DATA CENTRIC PROTECTION

PROTECTED DATA

Whenever. Wherever.

Boole Server is the software solution to protect the content of confidential documents against all intrusions, both internal and external. Presentations, documents, images, or spreadsheets: whatever the information to be secured, **Boole Server** persistently* encrypts the data, making them available in a controlled way and selectively setting those who can access them, how, when and for how long.

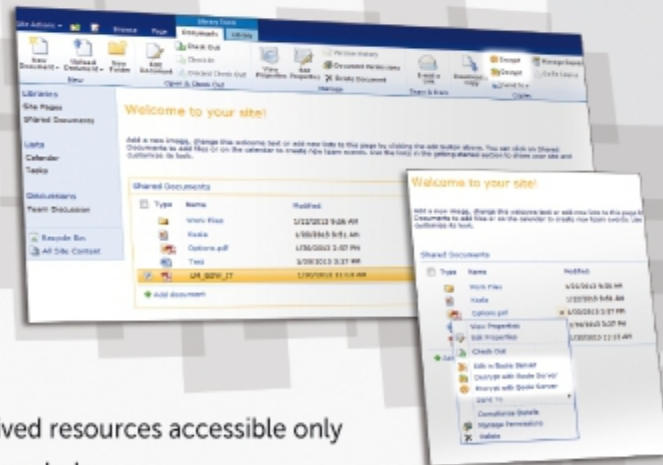

* The encryption system developed by Boole Server is defined as persistent because the applied protection still persists when the file is opened or edited by authorized users.

Boole Server® Microsoft® SharePoint® Connector

All Sharepoint users are offered a dedicated plug-in through which to use all Boole Server protection functionalities directly on the resources managed by the centralized system. A further server-side guarantee to protect and secure confidential data through functionalities, such as data encryption and granular access management to already archived files. The usability of Sharepoint and the protection of Boole Server are now offered together.

Key features:

- File encryption and decryption with 2048 bit encryption algorithm
- Constant protection of files and folders
- Opening and working in protected mode thanks to the persistent encryption offered by the Boole Server protection system
- Possibility of making Sharepoint archived resources accessible only to authorized users, selectively and granularly

Boole Server Connector is compatible with Microsoft SharePoint® 2010 and Microsoft SharePoint® 2013
