

Use Case: Data Centers

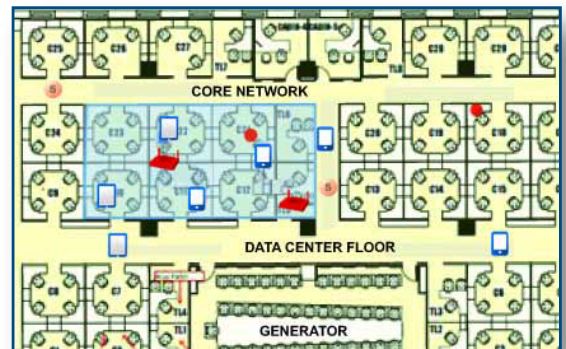

An estimated \$22 billion will be spent on new data centers worldwide this year (Gartner, 2011). Data centers are battling new challenges as security refers to physical threats and those that silently hack into networks. Organizations must take a comprehensive approach in order to mitigate risk.

With BYOD (bring your own device) gaining acceptance in enterprises, new risks are introduced. Personal devices that connect to the company network also connect to the home network, creating an out-of-network presence in the network and multiplying the number of endpoints connected to sensitive data. Continuous monitoring of devices in data centers and knowledge of any network interaction is vital.

AirPatrol's ZoneDefense protects against IP theft, lost revenue, reduced productivity, tarnished reputation, and more while meeting regulatory guidelines.

The Facts:

- Top data center networking challenges:
 - Network security (51%)
 - Network management (37%)
- The cost of a breach has increased 68% over the last 5 years (Symantec, 2011)
- In a 2011 study, 20% of data centers surveyed had experienced at least one breach in the last 18 months
- Data centers grow as enterprises work through consolidation projects and embrace server virtualization

AirPatrol increases organizational control and prevents data leakage. Not only can organizations monitor and detect all mobile devices in a data center through **AirPatrol's WLS (Wireless Locator System)**, but mobile device policy can be implemented with **ZoneDefense**. Based on contextual information, **ZoneDefense** provides real-time mobile security and policy enforcement.

With **AirPatrol**, data centers can control device capabilities according to role, location and appropriate access rights. When the security team is able to administer policy with mobile intelligence, these devices can deliver the personal and business mobility now required.
